## Quick Intro

Normally, the random map generation is done by generate a random map off-chain, and then upload the coordinates of the objects within the map to the blockchain. Since there is no repeatability, the world generated in this way is not as Web3. Users cannot generate a world like Sandbox by themselves, and the ownership of the world is still in the hands of Sandbox.

Therefore, this project decided to start from this point, directly using the on-chain data that can not be tampered with (such as block data, hash data) as the seed for the generation of abstract two-dimensional matrix map.

The Map can be: 1. Mint into NFT; 2. Further generate unique game maps.

Hopefully, this design can derive more gameplay for on-chain data.

# Quick Intro

Innovations of this project:

- New perspective to look at blockchains — Verifiable and self-growing distributed data;
- Abstract NFT: NFT only includes links to renderers;
- Cold-media NFT: on-chain data only responsible for 2D matrix map generation, and the users tell the story of the map;
- Arweave + Traditional Blockchains: Arweave stores stateless code (transformation rules) and assets. Traditional blockchains store data.

MINT!

## Background

# Background

This project focuses on a new perspective that blockchain is a verifiable self-growing distributed data source.

This kind of data source has the following characteristics:

- **Self-growing**

Data grows at a constant frequency. As a result, under determined rules, objects derived from metadata including area, treasure and NPCs grow at a constant speed!

- **Distributed**

Metadata is from the blockchain, so we do not need to worry about the risk of data being lost or tampered.

- **Verifiable**

All data is verifiable since they are on-chain metadata and transformation rules.

- **Free**

Reading blockchain data is free, so our data source is free!

## Project Details

## On-chain Steps

Step 0x01 Getting on-chain data

Step 0x02 Transform on-chain raw data according to on-chain rules to get the abstract maps

Step 0x03 Mint abstract maps into NFT

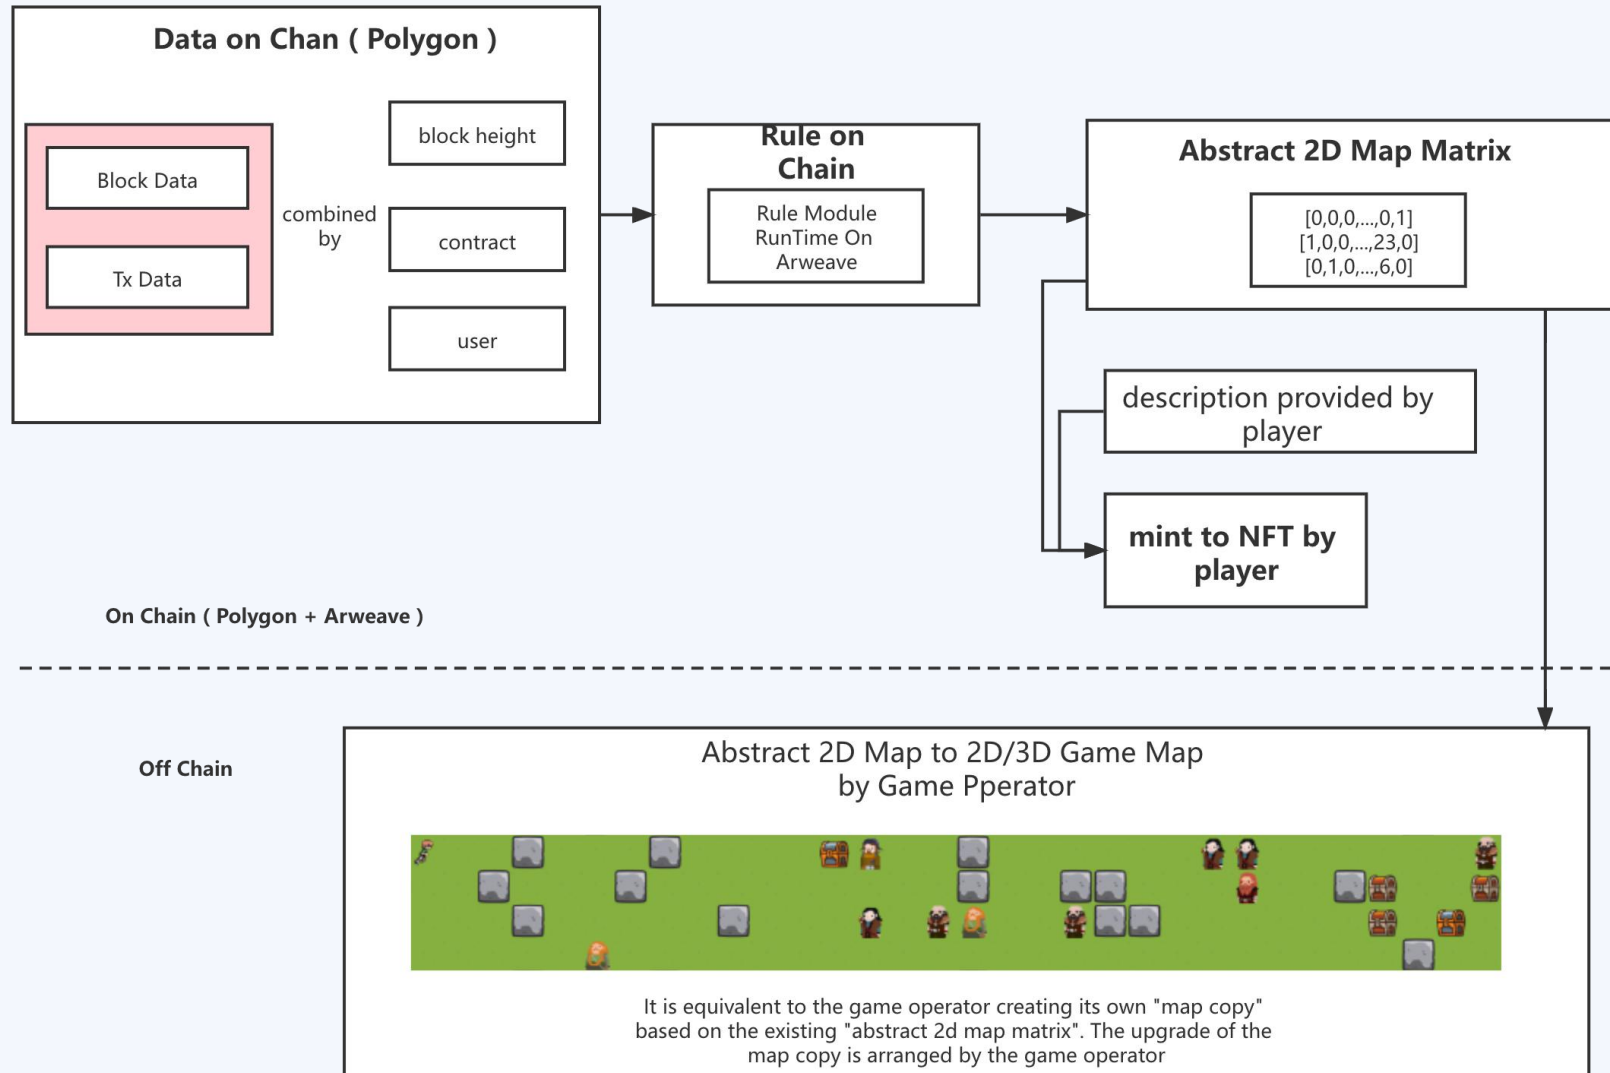

## Off-chain Steps

Step 0x04 Render abstract maps into real maps

# Project Details

# Scenarios

# Scenarios

This project is mostly for NFT players and game project teams.

NFT players can be categorized into “experiencing players” , “crafting players” , and “trading players” . These three types can be overlapped, which means one player can be of one type or multiple types.

# Scenarios——Player

- **Experiencing Player**

Experiencing players focus on the experience of gaming and networking in the game. For this type of player, exploring map and experiencing curated plots are more attractive.

- **Crafting Player**

Crafting players get excited when crafting and inventing. TaiShang World Generator brings three playing models that can be offered by game project teams:

- Stick Map NFT together to build a bigger map;
- Give story to NFT when minting NFT;
- Customize the rendering of map, as long as results and 2D abstract maps are consistent.

- **Trading Player**

For trading players, getting revenue from exchanging maps will make them satisfied.

## Scenarios——Game Project Team

For game project teams, TaiShang World Generator provides a crypto native way to generate the map and bring an initial group of player.

Game project teams can add new elements on the basis of the paradigm of this project:

- Purchase Map NFT for BD of the game;
- Let players provide Map NFT to build game economy;
- Only use open-source map generator if the game is not related to NFT.

Game project team can be creative and provide game rules and playing model, while NFT players can be the residents of TaiShang World to explore the different worlds designed by the game project teams.

## Progress&Future

**Now, we have:**

- 2D abstract matrix map based on on-chain data
- 2D game rendered on abstract matrix map
- Minting map and story into NFT (In Progress)

TaiShang World Generator will be the infrastructure for TaiShang Metaverse.

## Short term goal:

- Deploy Map NFT contract on Polygon;
- Continue developing TaiShang Map Generator;
- Display existing Tokens;
- Realize composing Maps into a larger Map;
- Give meaning to treasures and NPC;
- Add NFT as Character design.

## Long term goal:

We will build TaiShang Metaverse on the basis of TaiShang World Generator and other open source projects. We will attract users and developers to TaiShang Metaverse, and also add blocks to the whole Metaverse ecosystem. The tai-shang-map-generator will host interesting activities by the noncegeek

# Roadmap(Stage 1)

## 2022-Q1

- Publish Contract to Polygon Network(**Done**)
- Release v1 for tai-shang-world-generator
- NonceGeek runs 3 events on tai-shang-world-generator

## 2022-Q2+Q3

- tai-shang-world-generator become a mature tool for web3devCamp
- Release v2 for tai-shang-world-generator
- Partners can run events on tai-shang-world-generator

## 2022-Q4

- tai-shang-world-generator release the server version on “Playlink”
- With the help of tai-shang-world-generator, TaiShangVerse takes shape

## Team Members

## 团队介绍

# NonceGeek

**Website:** <https://noncegeek.com/#/>

**Members:** <https://noncegeek.com/#/buidlers>

**Project Team:** leeduckgo、msfew、ff、追忆似水年华、零月浅浅

NonceGeek is a distributed crypto native geek organization, focusing on “Cool-Oriented Programming”.
